Unit tests on cartoon steroids.

Take from the source:

QuickCheck Hypothesis JSVerify

You don't know what your inputs are.

You don't know what your inputs are.

Your properties are meant to hold over a broad set of inputs, they must be general.

You don't know what your inputs are.

Your properties are meant to hold over a broad set of inputs, they must be general.

How do you make meaningful assertions without re-implementing the code under test?

You don't know what your inputs are.

# Isomorphism Defined

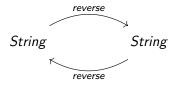

$$from(to(A)) = from \circ to = 1_A$$
  
 $to(from(B)) = to \circ from = 1_B$ 

#### Isomorphism Example: encode ←⇒ decode

 $decode(encode(JSON)) = decode \circ encode = 1_{JSON}$  $encode(decode(String)) = encode \circ decode = 1_{String}$ 

#### Isomorphism Example: reverse ← reverse

 $\begin{aligned} \text{reverse}(\text{reverse}(\mathsf{String})) &= \textit{reverse} \circ \textit{reverse} = 1_{\textit{String}} \\ \text{reverse}(\text{reverse}(\mathsf{String})) &= \textit{reverse} \circ \textit{reverse} = 1_{\textit{String}} \end{aligned}$

$$\mathsf{to}(\mathsf{from}(\mathsf{B})) = \mathsf{to} \circ \mathsf{from} = 1_{\mathsf{B}}$$

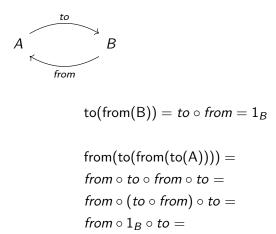

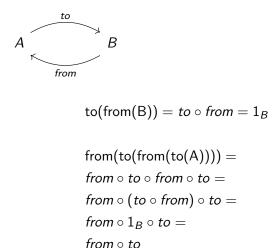

$$\mathsf{to}(\mathsf{from}(\mathsf{B})) = \mathsf{to} \circ \mathsf{from} = 1_{\mathsf{B}}$$

$$\mathsf{from}(\mathsf{to}(\mathsf{from}(\mathsf{to}(\mathsf{A})))) =$$

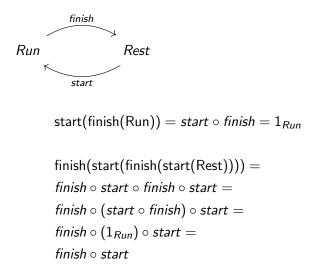

#### Idempotent Example: Run $\hookrightarrow$ Rest

 $\mathsf{start}(\mathsf{finish}(\mathsf{Run})) = \mathsf{start} \circ \mathsf{finish} = 1_{\mathsf{Run}}$ 

#### Idempotent Example: Run $\hookrightarrow$ Rest

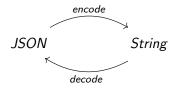

# Idempotent Example: $JSON \hookrightarrow String$

 $decode(encode(JSON)) = decode \circ encode = 1_{JSON}$ 

# Idempotent Example: JSON → String

```
decode(encode(JSON)) = decode \circ encode = 1_{JSON}
```

```
encode(decode(encode(decode(String)))) = encode \circ decode \circ encode \circ decode = \\ encode \circ (decode \circ encode) \circ decode = \\ encode \circ (1_{JSON}) \circ decode = \\ encode \circ decode
```

### Making Properties Easy

We know that properties are easy and effective when we have an isomorphism.

```
from hypothesis import given
from hypothesis.strategies import text

@given(text())
def test_decode_inverts_encode(s):
    assert decode(encode(s)) == s
```

### Making Properties Easy

We know that properties are easy and effective when we have an isomorphism.

```
from hypothesis import given
from hypothesis.strategies import text

@given(text())
def test_decode_inverts_encode(s):
    assert decode(encode(s)) == s
```

What about when we don't have an isomorphism?

# Making Properties Easy

We know that properties are easy and effective when we have an isomorphism.

```
from hypothesis import given
from hypothesis.strategies import text

@given(text())
def test_decode_inverts_encode(s):
    assert decode(encode(s)) == s
```

What about when we don't have an isomorphism?

Can we find an isomorphism?

#### Finding an isomorphism

FizzBuzz does not belong to an isomorphism.

```
from typing import List
def fizzbuzz(nums: List[int]) -> List[str]:
  res: List[str] = []
  for num in nums:
    s = ""
    if num % 3:
      s += Fizz''
    if num % 5:
      s += "Buzz"
    if s == "":
      s = str(num)
    res.append(s)
  return res
```

#### Finding an isomorphism

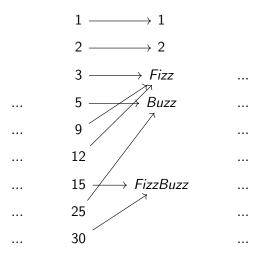

FizzBuzz does not belong to an isomorphism.

```
from typing import List
def fizzbuzz(nums: List[int]) -> List[str]:
  res: List[str] = []
  for num in nums:
    if num % 3:
      s += Fizz''
    if num % 5:
      s += "Buzz"
    if s == "":
      s = str(num)
    res.append(s)
  return res
```

What is the closest isomorphism we can find?

It helps to take a different perspective.

#### FizzBuzz as a Set Function

We cannot have an isomorphism because inputs *collapse* onto outputs.

This prevents construction of an inverse.

#### FizzBuzz as a Set Function, Partitioned Domain

$$\begin{cases}
1\} & \longrightarrow 1 \\
\{2\} & \longrightarrow 2
\end{cases}$$

$$\begin{cases}
3,6,9,12,...\} & \longrightarrow Fizz
\end{cases}$$

$$\begin{cases}
4\} & \longrightarrow 4
\end{cases}$$

$$\begin{cases}
5,10,20,25,...\} & \longrightarrow Buzz
\end{cases}$$

$$\begin{cases}
7\} & \longrightarrow 7
\end{cases}$$

$$\begin{cases}
15,30,...\} & \longrightarrow FizzBuzz
\end{cases}$$

$$\begin{cases}
16\} & \longrightarrow 16
\end{cases}$$

We have an isomorphism, can we fix the input type?

#### FizzBuzz as a Set Function, Partitioned Domain

$$\begin{cases}
1\} & \longrightarrow 1 \\
\{2\} & \longrightarrow 2
\end{cases}$$

$$\begin{cases}
3,6,9,12,...\} & \longrightarrow Fizz
\end{cases}$$

$$\begin{cases}
4\} & \longrightarrow 4
\end{cases}$$

$$\begin{cases}
5,10,20,25,...\} & \longrightarrow Buzz
\end{cases}$$

$$\begin{cases}
7\} & \longrightarrow 7 & ....
\end{cases}$$

$$\begin{cases}
15,30,...\} & \longrightarrow FizzBuzz
\end{cases}$$

$$\begin{cases}
16\} & \longrightarrow 16
\end{cases}$$

We have an isomorphism, can we fix the input type?

With an idempotent.

# FizzBuzz<sup>-1</sup> as a Set Function, Idempotent

We just pick one value from each input set.

This can be pre-composed with FizzBuzz to create an identity on the output set.

This means we have an idempotent on the input set.
